

Romain Clemencon

Copenhagen, Denmark • +45 23 83 23 93 • pro@romain.dk • linkedin.com/in/Romainclemencon • romain.dk

Software engineer at Novo Nordisk Engineering building the systems behind the design, delivery, and maintenance of pharmaceutical manufacturing facilities. Currently leading the migration of a legacy monolith to a distributed architecture and building the internal AI platform that lets developers and subject-matter experts alike create, share, and safely deploy their own tools. I take end-to-end ownership of hard problems, from legacy migrations and missing CI pipelines to greenfield features, and treat unfamiliar work as a chance to raise the bar for what we deliver.

SKILLS

Languages: C#, TypeScript, Python, SQL (T-SQL), Java, C

Backend & Architecture: .NET, ASP.NET Core, REST & SOAP integration, CQRS & event sourcing, ETL & CDC, SQL Server, SSIS, SQLite

Frontend: React, Vite, Tailwind, SCSS, Cypress

Cloud & DevOps: Azure (App Services, Entra ID/MSAL), Azure DevOps (Pipelines, self-hosted agents), CI/CD design, trunk-based Git workflows, Docker, AWS, Microsoft Fabric

AI Engineering: Claude Code (plugins, skills, agents), MCP (remote server development), Azure AI Foundry, GitHub Copilot, AI platform and governance design, CI/CD security gating for AI-built applications

EXPERIENCE

Novo Nordisk Engineering • Advanced System Developer

Copenhagen, Denmark • Oct 2023 – Present

- Leading the strangler-fig decomposition of a heavily customised third-party ERP serving ~125 concurrent daily users (EAV data model, fully on-premise, two-tier client-to-SQL architecture): proposed, designed, and built external services that take over its custom logic and synchronise back through the vendor's SOAP API and binaries, re-platformed them onto a hybrid cloud architecture (Azure App Services, background jobs distributed via Azure DevOps agents), and am now designing CQRS and event-sourcing foundations to fully decouple new development from the vendor system.
- Initiated NNE's AI-at-scale effort: made the case to my manager and CIO that AI needed organisational investment beyond GitHub Copilot, drove the adoption of Claude Code, and now spend 50%+ of my time enabling AI across the organisation.
- Designing and building an internal platform for AI-built applications: a harness-agnostic catalog and registry (plugins, skills, prompts, commands) with CI/CD pipelines, a deployment layer, security gates that vet applications before internal use, and remote MCP servers that standardise MCP across the company in place of scattered local setups, so subject-matter experts outside software can share, maintain, and peer-review the tools they create; defining its governance model with business and security stakeholders while piloting ahead of an org-wide rollout.
- Led a 4-person team redesigning a hybrid on-prem/cloud application (React, .NET 8, IIS, SQL Server, Azure App Services, Azure AD) bridging a legacy SOAP ERP with a modern SPA; cut page load times from >30 s to <2 s through API consolidation and cross-page caching.
- Authored the organisation's SDLC standards, version-control templates, and Git workflows (trunk-based development, standardised code review, gated staging and production releases), implemented them as automated build-validation pipelines with security gates that replaced manual deployments and cut release time from days to hours, and defended the standards directly in ISO 27001 certification audits.
- Resolved a recurring outage where the ERP's built-in export jobs, running unpredictably for 24+ hours against the production database, locked business-critical tables: applied immediate mitigations to restore access, then re-architected the exports to run in parallel on a replicated staging server using the vendor's CLI and Azure DevOps self-hosted agents, cutting runtime from 24+ hours to a few hours outside working hours and removing the load from production.
- Replaced the vendor's opaque export jobs with custom-built exports, bringing near-live, GxP-validated engineering data into the warehouse as the source of truth for facility projects across mechanical, process, electrical and instrumentation, automation, and engineering-management disciplines, consumed downstream throughout NNE and Novo Nordisk; this enabled CDC, the move to Microsoft Fabric, and the groundwork for CQRS.
- Automated a business-critical report delivered to parent company Novo Nordisk by reverse-engineering the ERP's generation logic and rebuilding it as ETL pipelines processing 500K+ daily records with self-healing schema adaptation; moved delivery from monthly to daily, cut runtime from hours to minutes, and eliminated the engineering effort previously spent producing it.

- Interviewed candidates, onboarded and mentored new engineers, and trained teammates on the production data systems I built, moving them from single-person to shared ownership as their primary incident responder; a go-to engineer across teams for AI, Azure DevOps, and software architecture.

Bank of America · Software Engineer

Dublin, Ireland · Jul 2023 - Oct 2023

- Built cross-project database integrations (IBM Db2, Python) for a risk-management team, partnering with tech leads and business analysts to deliver against regulatory requirements.

Huawei Ireland Research Center · Software Engineer Intern

Dublin, Ireland · Jan 2023 - Jul 2023

- Developed features for a high-performance, low-level network load balancer in C using DPDK kernel-bypass networking.

Trellix · Software Engineer Intern

Cork, Ireland · Jan 2022 - Sep 2022

- Migrated an on-premise application (WordPress frontend, heavily duplicated Java Spring services) to AWS over a 4.5-month project: consolidated redundant services, merging some back together where the split only added complexity, and re-architected email delivery from an unreachable on-premise SMTP server to AWS SES.

Stripe via Telus International · Technical Support

Cork, Ireland · Jul 2018- Dec 2021

- Supported Stripe API integrations for developers and merchants while completing my degree full-time.

EDUCATION

Munster Technological University · Bachelor of Science (Honours) in Software Development

Cork, Ireland · Sep 2019 – May 2023

Graduated with First-Class Honours (highest classification), every academic year.

Alejandro de la Flor Trellix Scholarship – 2021/2022

PROJECTS

cyli · Python, Cypress, uv

github.com/RomainClem/cyli · Dec 2025

- CLI tool that discovers, selects, and runs Cypress component and E2E tests from any project directory. Packaged with uv; used internally to streamline running tests.
